

Logan, volunteer

I've been swimming all my life. Since I can remember, but competitively for about three years.

It scares me sometimes. I really don't want to get to a point where I need like a wheel chair or a walker. I've been there and it's not fun, so by swimming I can exercise in a way that works for me

The aquatic studies, they do make a difference.

It's hard to tell things on your own. But if you have good evidence then you can figure it out.

If we didn't have research, I don't know where I would be today.

William: We were told early on that he may not walk, he may not talk. And you start looking for answers and then you realize that there are some studies out there and if you know we can do this study and it maybe help us get some answers, and if not it can help someone else

Thea: By Logan participating in clinical research studies we absolutely gained invaluable information how his body responds to certain things, to exercise, in the water, on land, to what kind of range he has.

I've always said you can't complain about something if there's a way to act on it in a positive way. We have a responsibility to help other people. If that means engaging in research that thirty forty fifty years down the road provides some insight into things that could be done differently to improve quality of life in whatever area you're looking at, I think that's a legacy.

Logan: I just want to help people. I want to do something with my life.

I probably want to do something in the medical field. Maybe a pharmacist or something,
